

EMS Runtime environment

My participation in the project is in a crucial part: development of the runtime environment, runtime process evaluation, own interpreter development.

Project's website: <http://dextro-research.eu/project/>

The project builds upon existing EMSG technology- an established Client-Server workflow management platform

The new and improved EMSG platform focuses on improving and expanding the platform, achieving better automation and platform scalability.

The EMSG software platform is suitable for development of highly complex information systems which must remain responsive and operational in intense workload conditions.

EMSG can help overcome problems caused by lack of resources in centralized information systems, especially with regard to multiple similar business organizations or multiple departments in a single business.

EMSG can lower the cost of initial development as well as the cost of ongoing support and further development and expansion.
